<td><strong>Abstract:</strong> The complex near-field interactions in metamaterials provide a unique opportunity to tailor their response by modifying the lattice structure. We show that a lateral offset between the layers of rings provides a convenient tuning mechanism. We also develop a semi-analytical approach based on calculating the interaction energy between a pair of resonators from their charge and current distribution at resonance. This allows us to predict the electrical and magnetic interaction constants, and to explain the observed shift in resonance.</td>

<td><strong>Abstract:</strong> Nanoscale semiconductors are promising platform for monolithic integration of materials with dissimilar lattice constants. In this talk, I will discuss the synthesis and characteristics of GaAs nanoneedles monolithically grown on Si with CMOS compatible temperature and process. I will review results on avalanche photodetectors with high gain and light emitting diodes. I will also discuss recent breakthrough of nanopillar lasers on silicon. This new material platform is excellent for active Si photonics. A second part of my talk will be on high-contrast subwavelength optics as they open up a new window to manipulate wave guiding properties. I will discuss some extraordinary properties of high contrast gratings (HCG) including ultra broad band reflectors, resonators and a new integrated optics using HCG as a platform. I will discuss tunable and multi-wavelength VCSEL array fabricated using HCG instead of conventional distributed Bragg reflectors. The HCG-VCSELs will bring cost-effective solution to CWDM local area networks and WDM PON. The HCG also will bring guided-wave optics to an unexplored regime and find many useful applications in lasers, filters, waveguides, lenses, saturable absorber switches, and sensors.</td>

<td><strong>Abstract:</strong> We predict that interfaces of periodically curved optical waveguide arrays can support a novel type of surface states which exist in a certain region of modulation parameters associated with the band flattening. Such linear surface states appear in truncated but otherwise perfect (defect-free) lattices as a direct consequence of the periodic modulation of the lattice potential. We report on the experimental observation of such defect-free surface modes in curved waveguide arrays fabricated in fused silica by a laser direct-writing technique. Our results demonstrate that the degree of surface wave localization can be controlled by selecting the modulation amplitude. We also describe theoretically and study experimentally nonlinear surface waves at the edge of a modulated waveguide array with a surface defect and a self-defocusing nonlinearity. We fabricate such structures in a LiNbO3 crystal and demonstrate that the interplay of different surface modes enables novel means of light shaping and switching between different output waveguides.</td>

<td><strong>Abstract:</strong> We develop optical nanomaterials with outstanding nonlinear properties such as second-harmonic generation from dielectrics or plasmonics effect from core-shell particles. Those nanoparticles can be seen as coherent non bleaching biomarkers for imaging applications or as optoelectronics materials generating an electric field (photovoltaic effect) or a thermal response (pyroelectric effect) under laser illumination. They can be integrated in optical techniques or devices for biological applications, optofluidics applications with low volume, or all optical nanocircuits.</td>

<td><strong>Abstract:</strong> A computationally straightforward and efficient method for obtaining the transient fields due to pulse excitation of the circular whispering gallery mode resonators will be presented. The method is based on the obtaining an analytical solution by the use of Laplace back and force transformation in combination with the residues evaluation at singular points and a rapidly convergent integral along the branch cut in the complex plane. This approach guarantees an accurate back transforming of the functions and allows us to gain understanding and insight into the fundamental processes occurring in microcavities.</td>
